Clinical Report

Brief Life History:

Patient has a documented history of neurodevelopmental and emotional regulation challenges that have persisted into adulthood. Symptoms related to attention span, executive function, and anxiety management have necessitated long-term clinical monitoring and a structured pharmacological approach to maintain functional stability in daily activities and professional environments.

Current Clinical Picture:

The patient presents with symptoms consistent with Attention-Deficit/Hyperactivity Disorder (ADHD) and Generalized Anxiety Disorder (GAD). These manifestations include difficulties with sustained focus, task organization, and the management of physiological and cognitive anxiety symptoms. The patient is prescribed Duloxetine (60 mg daily) for the management of anxiety symptoms and emotional regulation. Atomoxetine (80 mg daily) is utilized to address executive dysfunction and core ADHD symptoms. Additionally, Pregabalin (50 mg daily) is administered as an adjunct therapy for anxiety stabilization. The patient is stable under this current dosage, and continuation of the treatment is required during the period of international travel to prevent symptomatic relapse or withdrawal effects.

Diagnostic Impressions

Attention-Deficit/Hyperactivity Disorder (ICD-11: 6A05 / DSM-5: 314.01)

Generalized Anxiety Disorder (ICD-11: 6B00 / DSM-5: 300.02)
